This collection showcases student-developed video games produced under my guidance between January 2024 and June 2025, across four consecutive academic terms. Each playlist captures the breadth of student creativity, encompassing game mechanics, narrative design, interactive experiences, and technical implementation.

Through structured project-based learning and mentorship, students have demonstrated strong interdisciplinary skills, integrating design, programming, storytelling, and user interaction. The curated collection is available via four dedicated YouTube playlists, organized chronologically to illustrate progressive skill development over time.

In Winter 2025 (see Figure 3), students' project presentations exhibit notable improvements in audio fidelity thanks to the acquisition of a specialized microphone, enhancing the clarity and professionalism of recorded game demonstrations.

A complementary fifth playlist (see Figure 5) highlights laboratory work from *CTCH 223 / CS 207: Building Interactive Gadgets*. These videos demonstrate integration of game music, joystick-based control, and Arduino hardware, reflecting our program's commitment to interdisciplinary learning across Creative Technologies (CTCH), Computer Science (CS), and Design (DES).

Collectively, this collection emphasizes not only technical mastery but also creative exploration, collaborative problem-solving, and inclusive design practices, aligning with the goals of my teaching philosophy and research focus in accessible, socially-engaged game development.
